

RTM Performance 2024

Profitability is not about city — it's about channel and store format

Audience: Logistics Direction · RTM Team · Commercial Team

Data: 100,000 invoices · 8 cities · 3 channels · 3 store formats

January – December 2024

72 routes analyzed

dbt + Power BI pipeline

Validated narrative

The RTM portfolio: \$118M across 72 routes — the market is fully covered

\$118M

TOTAL REVENUE MXN
100,000 invoices · Jan–Dec 2024

19.3%

AVERAGE GROSS MARGIN
\$393 MXN avg ticket price

80.0%

COST TO SERVE (CTS)
Stable throughout the year

72

ROUTES ANALYZED
8 cities × 3 channels × 3 formats

The portfolio is fully mapped. The opportunity for 2025 is not expansion — it's **optimizing the channel and format mix** within existing routes. The analysis that follows shows exactly where that opportunity lies.

01

Context: Geography is not the lever

The city gap is just 3.5% — but the route gap is \$71k per year

Geography does not predict profitability — the city gap is just 3.5%

Expanding into new cities will not solve the margin problem

What the data says: With only 3.5% difference between the #1 and last-ranked city, opening presence in new cities is not the available profitability lever.

Key finding: The 8 cities distribute revenue remarkably evenly — Monterrey (\$15.0M) vs Tijuana (\$14.5M). Geographic distribution is balanced. Margin variability exists, but it lives at a different level.

The question that follows: If all cities generate similar revenue, why are some individual routes within those cities far more profitable than others?

02

Tension: The real gap lives in channel and format

Within the same cities, the gap between the best and worst route is \$71k MXN per year

The real gap is not between cities — it's between routes within the same city

\$355k MXN of margin is locked in the 5 weakest routes

\$350k AVG GROSS MARGIN · TOP 5 ROUTES \$401 MXN revenue/unit · CTS 79.8%	\$302k AVG GROSS MARGIN · BOTTOM 5 ROUTES \$381 MXN revenue/unit · CTS 80.2%	\$71k GAP PER ROUTE PER YEAR \$355k total across 5 routes — recoverable
--	---	--

If the 5 weakest routes operated with the economics of the star routes, the portfolio would recover **\$355k MXN of gross margin annually** — without adding a single new route. What separates the top routes from the bottom? The data points to two factors: channel and store format.

The Offline channel fell behind in H2 — the signal is small but clear

+0.18%

OMNICHANNEL H2 GROWTH

+0.18%

ONLINE H2 GROWTH

-0.11%

OFFLINE H2 VS H1 DECLINE

The winning combination: Omnichannel + Super — Express drags the portfolio across all three channels

Revenue fluctuates — CTS does not. The margin gap is a channel-format problem, not a cost problem

The cost structure is fixed — every margin improvement goes straight to the bottom line

Critical implication: CTS remains in the 79.8–80.2% range across all 12 months of 2024, with a variation of just **0.4 percentage points** — regardless of revenue peaks in January, August, and October.

What this means for restructuring: There is no "hidden cost" to restructuring Express routes. The cost structure is homogeneous across the entire portfolio. Every peso of margin recovered through channel or format migration reaches the bottom line intact — the operational cost does not absorb the gain.

The conclusion: The \$71k gap between star routes and weak routes is **100% a channel and format mix problem** — and it is 100% recoverable.

03

Resolution: Three routes set the standard — three decisions capture the opportunity

\$355k MXN annually available without adding a single new route

Three routes define what's possible — and five routes show what's being lost

Star routes share a pattern — and that pattern is replicable

STAR ROUTES (UPPER LEFT QUADRANT)

- CDMX Offline Hyper**
\$359k MXN margin · CTS 79.8% · \$401 MXN/unit
- Monterrey Omnichannel Super**
\$355k MXN margin · CTS 79.8% · \$399 MXN/unit
- Puebla Omnichannel Express**
\$351k MXN margin · CTS 79.9% · \$397 MXN/unit

COMMON PATTERN

Omnichannel or Offline channel · Hyper or Super format · CTS < 79.9% · Ticket > \$397 MXN

CRITICAL ROUTES (LOWER RIGHT QUADRANT)

- Querétaro Offline Express**
\$288k MXN margin · CTS 80.3% · \$383 MXN/unit
- León Offline Express**
\$295k MXN margin · CTS 80.2% · \$380 MXN/unit

COMMON PATTERN

Always Offline · Always Express · CTS > 80.2% · Ticket < \$385 MXN

\$355k

MXN of recoverable margin — without adding a single new route

Restructure 5 weak routes to star route economics

\$355k

RESTRUCTURE 5 WEAK ROUTES
\$71k per route per year

\$201k

COST OF INACTION OVER 3 YEARS
 $\$67\text{k/yr} \times 3$ · just 2 Express routes

\$180–220k

OMNICHANNEL MIGRATION 5% OF VOLUME
Across the 10 weakest Offline routes · Q2 2025

Three decisions the RTM team can execute immediately

R1 — Protect and scale the 3 star routes Priority frequency · Preferential stock · Commercial terms review	HIGH CONFIDENCE Field Ops · Jan 2025	CTS < 79.9% · Margin > \$350k across 3 routes
R2 — Restructure Offline Express routes (Querétaro + León) Option A: migrate to Omnichannel · B: consolidate stops · C: managed exit	HIGH CONFIDENCE RTM Manager · Mar 2025	Margin ≥ \$320k MXN by Q2 2025
R3 — Accelerate Omnichannel migration 10 lowest-ticket Offline clients/city · digital onboarding with commercial support	MEDIUM-HIGH Commercial + Logistics · Mar 2025	+0.3 pp margin · 5% volume converted · Q2

Action plan — next 90 days

#	ACTION	OWNER	DEADLINE	SUCCESS METRIC
1	Review route plan for Querétaro Offline Express	RTM Manager	Mar 2025	Margin ≥ \$320k MXN in Q2
2	Omnichannel conversion pilot in 2 Offline routes	Commercial + Logistics	Mar 2025	+0.3 pp margin
3	Define visit frequency for top 10 routes	Field Operations	Jan 2025	100% star route coverage
4	Review cost structure for Hyper Omnichannel	RTM + Finance	Mar 2025	CTS% < 80.0%
5	Monthly route review cadence	RTM Leadership	Feb 2025	Active dashboard with KPIs

Program success criterion: Increase average portfolio margin from **\$328k to \$345k MXN per route** by December 2025 — equivalent to a 5.2% improvement over the current baseline.

Appendix — Sources, methodology and limitations

DATA & PIPELINE

- **Source:** Mexico FMCG Retail Sales Customer Inventory (2024)
- **Pipeline:** Snowflake raw → dbt staging → marts → 4 CSVs → Power BI
- **Route defined as:** City × Channel × Format (72 unique combinations)
- **CTS:** Total cost / Total revenue per route — proxy that excludes transportation logistics costs not captured in the transactional dataset

TECH STACK

- Snowflake · dbt Core · DuckDB · Python
- Power BI (interactive dashboard)
- Marp (executive presentation)

QUALITY & VALIDATION

- **100,000 rows** post-pipeline · 0 nulls in critical columns
- 72 unique routes · 288 customer profiles · 64 product combinations
- Arithmetic check: Revenue $\approx$ Cost + Margin ✓
- Channel share: sums to 100% ✓

LIMITATIONS

Single-year dataset (2024). No year-over-year comparison available — H1/H2 split used as internal trend benchmark.

CTS is a proxy — excludes transportation and distribution logistics costs not captured in the transactional dataset.
